1 Property

$\forall S \in \mathbb{R}, \quad x < Baud(MAX)$

$$Freq(S) = \frac{Hi(S)}{Lo(S)} \cdot Weight(x)$$
$$-\frac{Weight(S)}{Freq(S)} = \frac{Hi(S)}{Lo(S)}$$

Thus by Hartley's Law, the weight of S over its frequency may be equal of the division between the highest signal and lowest signal of S .
